DRILLMAP / COWORKER GUIDE

Create a practice schedule

Use Test controls to try sample student analytics, inspect a weekly plan, and test how the next week adapts.

Before you begin

Sign in with an admin account and use **My student side**. These controls change your own test profile. The **All students** workspace shows real students on the real date.

1. Open your test profile

Open the workspace menu in the header and choose **My student side**. On a large screen, **Test controls** appears on the right. If collapsed, click **Expand**. On a small screen, tap the **Real date** or **Simulated** date button in the header.

2. Complete the study settings

If onboarding appears, enter the test profile: platform, current / average practice-test score, goal score, daily capacity, preferred practice-test day, accommodation, and goal test date. Choose **7Sage** for the standard analytics workflow, then click **Generate my schedule**. You can change these values later in **Study settings**.

3. Choose the date you want to test

For a full Monday-Sunday plan, click **Next Monday** before creating the schedule. For a midweek test, click a later day in the week strip, or enter a date under **Move to a later date** and click **Move**. Past dates and today cannot be selected.

4. Generate and review a sample

Under **Sample analytics**, select **Improving**, **Steady**, or **Slipping**, then click **Generate sample**. The app opens **Review sample analytics** on This week. Edit the accuracy percentages and priority flags for the scenario you want. You can add a question type or remove a row.

5. Approve the sample and inspect the plan

Check both statements: **I reviewed and approved these sample values.** and **Use this sample as my latest analytics.** Then click **Confirm snapshot**. If the week has no saved schedule, the app creates it. In **This week**, use **Whole week** or **One day** to inspect the activities, minutes, capacity warnings, and reasons.

A generated sample is a draft until you confirm it. Editing a row clears both approval checkboxes, so check them again after your final edit.

Compare weeks and settings

A saved weekly schedule stays fixed. Use a new week or an explicit rebuild when you want a different plan.

Test the next week

1. Record progress before moving

In **This week**, mark selected activities **Done** or **Skip**. Enter **Actual min** if useful. To test the effect of missed work, deliberately skip some activities before creating the next week.

2. Move to the following Monday

Click **Next Monday** in Test controls. Moving within the same week keeps its saved plan. Entering a later date can also test a future or midweek scenario. Moving dates clears any unapproved sample draft.

3. Approve fresh analytics for that week

Generate another sample, review the values, check both approval statements, and click **Confirm snapshot**. Every new week needs an approved snapshot from that Monday-Sunday week. Last week's approval alone cannot create the new plan.

4. Compare the saved plans

Use **Progress** to inspect past weeks and **This week** for the current plan. Compare question types, amounts of work, practice-test placement, warnings, and reason sentences. The next plan can use earlier analytics and the immediately preceding week's skipped work.

Try a different plan in the same week

Change the test profile in **Study settings**, or generate and confirm another analytics sample. Then click **Rebuild this week** and **Confirm rebuild**. The app deletes this week's schedule and check-ins, then returns to This week to create a plan from the current settings and analytics. Earlier weeks stay saved.

Rebuild uses the current simulated day

A plan first created midweek leaves earlier non-rest days unscheduled. Rebuilding midweek uses that same current day. To compare full weeks, create or rebuild while the simulated date is Monday.

What the sample directions mean

Improving generally raises accuracy relative to the latest approved analytics. **Steady** makes small changes. **Slipping** generally lowers accuracy. The first sample starts from a profile based on the current score because there is no earlier snapshot to compare.

Samples include random variation. For an exact comparison, edit the values and priority flags yourself and record them. Approving extra snapshots also changes the analytics history used for later plans.

REFERENCE / RESETS AND HELP

Start over with the right reset

Read the deletion summary in the panel before confirming. Reset actions remove saved data from your own student side.

Rebuild this week

Use this after changing settings or analytics for an existing week. Deletes **this week's schedule and activity check-ins**. Keeps the simulated date, analytics snapshots, study settings, and earlier weeks. Click **Confirm rebuild**.

Reset test data

Use this to start a new test run with the same study settings. Deletes **all weekly schedules, activity check-ins, and analytics snapshots**. Keeps study settings and the admin account. Returns to the real date. Click **Confirm reset**, then generate and approve a fresh sample.

Reset everything

Use this to test onboarding from scratch. Deletes **all weekly schedules, activity check-ins, analytics snapshots, and study settings**. Keeps the admin account. Returns to onboarding on the real date. Click **Confirm reset**.

If something does not work

The panel is missing. Use an admin account and switch to My student side. Expand the dock on a large screen or open the date button on a small screen.

Generate sample is unavailable. Complete onboarding first. The panel will tell you when a student profile is required.

Confirm snapshot is disabled. Check both approval statements after editing the sample. Any row edit clears the approvals.

The schedule did not change. That week already has a saved plan. Rebuild this week to apply the new settings or analytics, or move to the next week and approve a fresh sample.

Rebuild this week is disabled. There is no saved schedule for the current week. Create one by approving a sample first.

You need to move backward. Dates only move forward. Reset test data returns to the real date and deletes test history. Reset everything also removes study settings.

A quick test run

Complete onboarding. Move to Next Monday. Generate a Steady sample and confirm it. Inspect the plan and mark a few activities Skip. Move to Next Monday again. Generate an Improving sample and confirm it. Compare both weeks in Progress.

Prepared October 1, 2026. Instructions checked against the current DrillMap application source, including Test controls, sample review, weekly schedule creation, and reset behavior.
